

Rio™ System Integration

- Rio™ RTLS Software API provides the sensor system data access and configuration for integration with your software system.
- Rio™ RTLS Pro Software comes with customizable user dashboard, report generator, and customizable business rules builder and alerts engine.
- The Rio software team is available for full software system integration with your existing software and ERP systems.
 - Our team employs the exposed web services endpoints of the ERP system, and build custom business logic and storage solutions using mature, powerful software languages/ecosystems like Java, Python, and Node.js that interface easily with common databases.
 - We apply the web service data transmission formats that work best for the application, whether JSON, XML, or a custom method. If the existing ERP system and environment requires custom logic, our team can develop modules that run on the customer's existing systems to expose the endpoint, transform/parse/manage incoming data in any way, then store it to a relational or non-relational database or similar location used by the customer's existing software systems. Or we can just simply deliver data to the endpoint in the format that your system needs.
 - We can set up customized APIs on the Rio™ platform that auto-scale up to handle any amount of sensor data traffic, and can then trigger subsequent actions/logic which could include passing data into one or more of your systems.
